

Cities of the future

A rising population, increasing material expectations, conflicts, economic transitions and climatic changes are all reshaping how and where we live. So how do we respond?

Cities will become an increasingly important part of the answer to this question. In 2014, for the first time, more people lived in urban areas than in rural areas. This change has been rapid as in 1950, 30 per cent of the world's population was urban, and by 2050, 66% of people are predicted to be urban. UN projections show that urbanization combined with the overall growth of the world's population could add another 2.5 billion people to urban populations by 2050, with close to 90 percent of the increase concentrated in Asia and Africa.

Such rapid growth creates tremendous opportunities and also tremendous challenges. The potential exists in cities for vibrant communities, long-term environmental sustainability, efficient transport and excellent infrastructure. At the same time, there is also the potential for ever-increasing pollution, urban sprawl, high-carbon lifestyles and waste of resources.

Sustainable cities was the ideal topic for the Forum to explore first as it brings together social, biological and physical sciences as well as the arts and the humanities. Each month, a rich mixture of policy and decision makers from government and business, technical experts and researchers were invited to be expert witnesses and to provide their perspective on sustainable cities and the governance systems needed to support them.

Our report - 'Cities of the Future' - uses the discussions during these meetings and the testimonies of the witnesses to explore future research questions related to three areas: where we live, how we live in cities, and how cities respond to change.

Our aim is to ask questions, not to answer them. In doing so, we hope that this report will open up new research avenues for us all to explore in the future.

"Environmental sustainability is a crosscutting multidisciplinary challenge that requires the input of minds from all fields to provide the expertise that will help society make responsible decisions for the future. The Forum's role is to provide the opportunity for stimulating these crossdisciplinary conversations."

The Cambridge Forum for Sustainability and the Environment was established in 2013 in the University of Cambridge. Chaired by Lord Martin Rees, it meets once a month, bringing together thought leaders from the worlds of research, policy and industry to talk about some of the great sustainability challenges the world faces in the future and the research pathways which will help to prepare for and address those challenges.

Forum members for this topic were drawn from 14 University Centres, Departments and Institutes, and included: Dr Bhaskar Vira, David Cleevely, Professor Doug Crawford-Brown, Dr Emily Shuckburgh, Gordana Najdanovic, Dr Helen Curry, Dr Hildegard Diemberger, Professor Koen Steemers, Professor Larry Sherman, Lord Martin Rees, Dr Mike Rands, Dr Miles Parker, Dr Moira Faul, Dr Nicolette Bartlett, Professor Paul Linden, Professor Peter Guthrie, Polly Courtice, Dr Rosamunde Almond and Dr Tiago Cavalcanti

Six core research challenges

Our discussions identified six core challenges to current knowledge that will require not only new research, but also new research directions, new ways of conceptualising the challenges and a generation of scholars trained at the interface of environmental, economic and social sustainability.

A global effort of comparative analysis to compare and contrast the performance of cities across an array of indicators. Such a rich database would allow something akin to structural factors analysis to identify the aspects of size, form and design of cities that are most influential for these indicators, as well as the context within which the effects are expected.

To improve our understanding of how the scale, location and design of green and blue spaces can deliver services to cities and to surrounding landscapes. A mantra of 'the larger, the better' ignores pressures to create more housing and the impacts on land values.

To create ICT (Information and Communication Technology) enabled sensor and data systems that improve sustainability by both making significant changes to existing ways of collecting and analysing data and by mobilising social action based on those data.

To enable smooth transitions between bottom-up and top-down decisions in governance: allowing bottom-up solutions where they are effective and top-down solutions where they are needed.

To design cities which can be utilised as living laboratories for experimentation: identifying parts of the city where experiments can be conducted and which have systems to monitor and assess the results of the experiments and the governance structures that respond to the results.

To establish a 'good enough' principle that is as robust as the precautionary principle, which would involve specifying this concept precisely in terms of engineering, finance and planning and designing a system of monitoring 'good enough' solutions so when they fail, they do so with forewarning.

Our report

The 'Cities of the Future' report explores six themes related to each of these research challenges (see Figure 1). Each chapter is framed by an overarching question and begins by posing three further questions for which answers are poorly developed at the moment. The gaps and the 'wicked problems' people identified during the Forum meetings are then used to explore future research pathways in more detail. Boxes provide specific examples given by the witnesses and Forum members. Each section then concludes with a succinct statement outlining 'The research challenge on the horizon'.

The testimonies of the witnesses and the conclusions drawn are necessarily qualitative and personal, as is the nature of such discussions at the edge of knowledge. They are built on the collective experience of the Forum's participants, framing questions in different ways.

The aim of the Forum is to generate new questions and to find ways in which research across and between different disciplines can help us to explore the 'unknown unknowns'. Our hope is therefore that this report will stimulate new conversations between the worlds of academia, policy and industry and bring fresh ideas and perspectives in order to help to research, prepare for and address the challenges that cities face in the future.

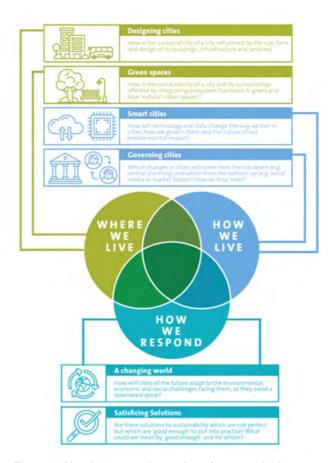

Figure 1: Key themes and questions frame each chapter.

Report Editors: Prof. Paul Linden, Prof. Doug Crawford-Brown, Dr Rosamunde Almond, Simon Patterson and Dr Elizabeth Tyler

We would like to thank everyone who took part in Forum meetings over the course of the year, especially the expert witnesses and guests who joined us from across and outside Cambridge and who contributed their time, knowledge and expertise to these discussions:

Witnesses: Prof. Alan Short, Dr Britt Baillie, Dr Felipe Hernández and Prof. Marcial Echenique (Dept. of Architecture), Prof. Sir Alan Wilson and Prof. Mike Batty (UCL), Alex Nickson and Mark Kleinman (Greater London Authority), Prof. Ash Amin (Dept. of Geography), Carmel McQuaid (M&S), Prof. Catharine Ward Thompson (University of Edinburgh), Dr Craig Davies (European Bank for Reconstruction and Development), Dr David Ogilvie (Centre for Exercise and Dietary Research), Dr David Pencheon (NHS England), Diane Haigh (Allied Morrison), Dame Fiona Reynolds (Emmanuel College), Prof. Frank Kelly (Dept. of Pure Mathematics and Mathematical Statistics) Jo da Silva (Arup), Jon Alexander (The New Citizenship Project), Kirsten Henson (KLH Sustainability), Prof. Lawrence Sherman (Institute of Crimonology), Lawrie Robertson (Buro Happold), Prof. Richard Sennett (LSE), Simon Marsh (RSPB), Stephen Aldridge (DCLG)and Prof. Steve Evans (Institute for Manufacturing).

Guests Prof. Alison Smith (Dept. of Plant Sciences), Prof. Charlie Kennel (CSaP), Dr Claire Craig and Eleri Jones (Government office for Science), Darren Ferry and Mike Ratterman (Kier Group), David Hart (British Airways), Dr Deborah Pullen BRE), Ed Barsley, Jamie Anderson, Max Sternberg, Dr Wendy Pullan and Dr Ying Jin (Dept. of Architecture), Dr Heather Cruickshank (Dept of Engineering), Hywel Lloyd, Prof. Lynn Gladden (Pro VC of Research), Dr Mark Dowson (Buro Happold), Dr Peter Hedges (Research Strategy Office), Richard Morris (National Trust), Stijn van Ewijk (UCL).

Partners: This topic was carried out in partnership with the Cambridge Centre for Science and Policy under their Policy Challenges Programme.

Feeding the world

How can food supplies and supply chains be made more resilient?

At a glance

The overarching theme of our third topic was 'risk, resilience and response' and between October and December 2015, we focused on food water security and supply chain resilience. These three meetings were jointly hosted with the Joint Research Centre (JRC) of the European Commission and formed the core of a pilot activity under a new Memorandum of Understanding between the two institutions to enhance inter-institutional collaboration.

'Green growth and sustainability' was chosen as the pilot topic and the Forum worked with JRC and University Strategic Initiatives, including the Cambridge Conservation Initiative and the Global Food Security Initiative, to develop a series of meetings and projects to explore potential areas for future collaboration. The three co-hosted Forum meetings formed the focal point of this programme and each month, expert witnesses and guests from the JRC came to Forum meetings and helped to shape the theme as a whole.

This summary provides an overview of some of the 'wicked problems' and questions generated during these discussions. Additional outputs put these questions in a broader context and explore potential future collaborations between the JRC and Cambridge.

Taking a global view

The quality and quantity of data were both recurring themes throughout the discussions. In the first meeting, Professor Alan O'Neill, the founding Director of the NERC National Centre for Earth Observation, highlighted that big data is providing new kinds of datasets and opportunities to measure resilience and risk at a global scale in real-time and at high resolution. However, the volume, complexity and heterogeneity of large-scale datasets also pose challenges for both researchers and policymakers. As a result, there is a need to train more data scientists who are not only technical experts but also familiar the underlying environmental, social and economic issues.

This will enable them to know both what questions to ask and how the data can be used to answer them. Although innovation and developing new techniques is important, solving some of these problems may not necessarily involve more advanced technology. Dr Matt Smith, an ecologist who works in the Computational Science Lab and Microsoft Research, suggested that some of the data challenges we face are quite basic and technical solutions already exist, perhaps in other fields. Finding ways to apply existing technology to solve problems is therefore as important as developing new technologies.

In addition, Thierry Nègre, the Head of the Food Security (FOODSEC) Group at JRC, suggested that, despite the recent advances in data collection, there is an issue with the scarcity and quality of data in areas such as food security or food production. This was, particularly in developing contexts because of issues such as the lack of resources or funding and institutional barriers rather than due to any particular technological limitations. This compromises the ability to develop accurate models in key areas. The limitations posed by institutional barriers with regard to both data collection and effective use of data was mentioned frequently throughout the meetings.

Turning data into information

A related problem was that of turning data into useful information and then communicating that information in a meaningful way to end-users. Currently, there is a disconnect between the amount of data, the information gleaned from these data and people's ability to turn theory into practical solutions. For example, satellite programmes such as the new Copernicus 'family' of satellites are generating vast amounts of high resolution data which will enable us to see global environmental changes in a way never before possible. Being able to process and analyze data on such a massive scale is a huge challenge in itself. Turning those data into information people can use to make decisions adds another layer of complexity. Craig Mills, the CEO of Vizzulaity, described the work his company does to visualise complex scientific datasets to create clear,

Key questions

Through our discussions, we identified four key areas where more research is needed:

- How can we move from tracking historical trends in food and water supplies to identifying emerging risks and create future projections and scenarios?
- Decisions are taken at multiple scales from local to international. What place does satellite data have in decision-making at all of these scales and is it feasible to use it to make local scale decisions?
- Given the pace of change, how do we collect and analyse data in a way that feeds into policy processes in time to be most effective?
- What role can citizen science play a role in this 'new world' of open, big data?

Catalyzing collaboration

To help facilitate the collaboration between JRC and Cambridge, an EPSRC Institutional Sponsorship Grant was given to a joint project between the Forum and the Global Security and Crisis Management Unit at JRC. This four-month project employed a Cambridge-based research assistant, Adrià Descals Ferrando, to start to explore questions which could be answered by overlaying two of JRC's remote-sensing datasets:

Global Surface Water Explorer, which measures changes in the location and persistence of surface water globally, by region or for a specific area.

Global Human Settlement Layer, which provides information about where people live, how big settlements are, how they have changed over time and the density of built up areas.

Both of these have unprecedented levels of spatial detail for global data (30m resolution) and span the last 30 years. The project explored ways in which combining data from both of these could provide information to inform policy, such as tracking progress towards the Sustainable Development Goals, and enable faster responses to environmental extremes and acute threats.

communicable messages that people can interact with and understand. He and his team often have to work closely with researchers to ensure that the messages from the data are clear and simple while still maintaining its scientific integrity. Presenting complex information is a real challenge and both technological solutions and way the results are communicated needs to be adapted to suit the target audience. More research into how data affects decision makers was also recommended, as there can be external factors that override the influence of scientific advice on policy decisions.

Using big data effectively and ethically was another recurring theme. Stephen Peedell, a specialist in geospatial information technology from the Land Resource Management Unit at JRC, argued that remotely sensed data does not replace the need for ground sensors and information, but instead compliments it. Remote sensing data will always needs to be 'ground-truthed', and aligning it with economic, social and biological data provides both context and cements connections between changes in the environment and the effects on people's lives. Consequently, there also needs to be better links between large-scale datasets and data that are gathered at a more local level.

There were also concerns over the proprietary nature of some datasets, issues regarding data standards and data confidentiality. Publicly funded institutions such as the Joint Research Centre have open data policies and strict guidelines surrounding data standards as well as the infrastructure to provide technical and content updates and support. Other data providers, such as private companies, do not have such obligations and can choose which data they put in the public domain, for how long and the conditions they attach to using it. Privately held data contains a wealth of detail and information and there is a danger that if these datasets are not openly and transparently made available, opportunities to address local and global scale challenges may be lost. Sharing data may raise confidentiality concerns, but these should be weighed against the potential value derived from data being examined from a wide range of perspectives.

Taking a systems approach

The resilience of food chains was examined, and Dr Mukesh Kumar, from the Institute for Manufacturing, identified three principle areas of concern: crop failure, product failure and supply chain failure. This was echoed by Professor Jaideep Prabhu from the Judge Business School who discussed food waste in developing countries stemming from supply chain issues, such as the lack of information for farmers concerning neighbouring areas and consumer requirements as well as the need for a better cold chain.

Throughout the three months the need for a multidisciplinary approach to food security was emphasised, by Dr Francois Kayitakire. He leads a team working on resilience and on food and nutrition security assessment at JRC and he argued that there are a number of interrelated issues that must be considered as part of a system approach. These range from conflicts surrounding resources to the need for income-related social protection to help bolster access to food. Our goals and the means to achieving them should therefore orientate around a problem, rather than a discipline. This general approach was echoed by Dr Drew Purves, an ecologist who now works for Google Deepmind. He emphasised that food must be part of a global system, particularly given the increasing risk posed by climate change. It was also repeatedly stated that a long-term view is needed to build resilience in food and water systems, although short-term interventions are also needed when an immediate impact is required.

The Cambridge Forum for Sustainability and the Environment was established in 2013 in the University of Cambridge. Chaired by Lord Martin Rees, it meets once a month, bringing together thought leaders from the worlds of research, policy and industry to talk about some of the great sustainability challenges the world faces in the future and the research pathways which will help to prepare for and address those challenges.

Secretariat: Prof. Paul Linden (Director); Dr Rosamunde Almond (Executive Secretary) and Simon Patterson (Content Writer and Editor).

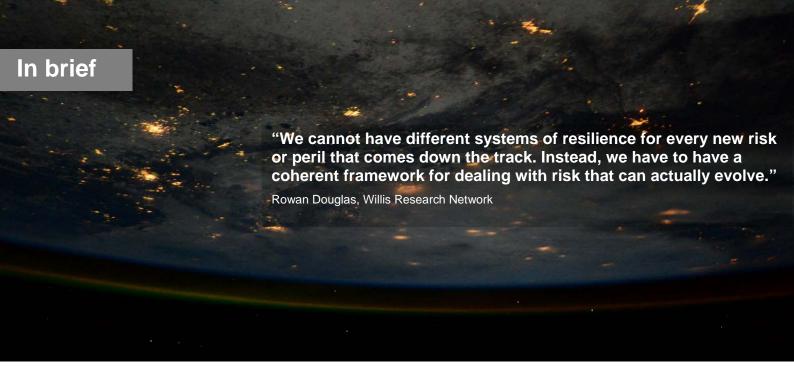

Forum members for this topic were drawn from 15
Departments, Centres and Initiatives, including: Prof. Alison
Smith (Dept. of Plant Sciences); Prof. Danny Ralph (Centre for
Risk Studies); Dr Emily Shuckburgh (British Antarctic Survey);
Dr Helen Curry (Dept. of the History and Philosophy of
Science); Dr Hildegard Diemberger, (Dept. of Social
Anthropology); Prof. Doug Crawford-Brown and Prof. Ian
Hodge (Dept. of Land Economy); Prof. Ian Leslie (Computer
Laboratory); Dr Jake Reynolds and Polly Courtice (Cambridge
Institute for Sustainability Leadership); Dr Julian Huppert
(POLIS); Prof. Koen Steemers (Dept. of Architecture); Dr Miles
Parker (CSaP); Prof. Paul Dupree (Dept. of Biochemistry); Prof.
Peter Guthrie (Dept. of Engineering); Dr Shailaja Fennell
(Centre for Development Studies) and Prof. Susan Owens
(Dept. of Geography).

Witnesses: Stephen Peedell, Dr Francois Kayitakire and Thierry Nègre (JRC); Dr Mukesh Kumar (Institute for Manufacturing, University of Cambridge); Prof. Alan O'Neill (Cavendish Laboratory, University of Cambridge); (JRC), Dr Matthew Smith (Microsoft Research), Craig Mills (Vizzulaity), (JRC), Prof. Jaideep Prabhu (Judge Business School) and Dr Drew Purves (Google Deepmind).

Internal guests: Dr David Coomes and Dr Will Simonson (Dept. Plant Sciences); Prof. Keith Richards and Therese Rudebeck (Dept. of Geography); Dr Marla Fuchs (Research Strategy Office); Dr Martin Roberts (Cambridge Centre for Sustainability Leadership); Dr Nazia Mintz-Habib (Centre for Development Studies) and Kirsten Van Fossen (IfM).

External Guests: Gregoire Dubois and Dr Pamela Kennedy (JRC); Daria Dadam (BTO); Dr Gavin Shelton, (FFI); Dr Graeme Buchanan (RSPB); Prof. Neil Burgess and Tim Wilkinson (UNEP-WCMC) and Simao Belchior (Vizzuality).

Taking a long term view of cities

How can cities become more resilient and how might big data shape the way we view and plan them in the future?

At a glance

The overarching theme of our third topic was 'risk, resilience and response' and between January and March 2016, we focused on cities. These meetings built on some of the questions that framed our discussions during our first topic, sustainable cities. Expert witnesses from the worlds of policy, research and industry helped us to explore the role that technology and big data could play in making cities more resilient to short term shocks and long term changes in the environment

In January and February, we discussed new ways to layer social, economic and environmental datasets in order to assess risk and resilience in cities, and how vulnerable they are. In March, we turned to catalyzing change and ways that cities can become more resilient in practice.

This article provides an overview of key emerging themes and some of the 'wicked problems' and questions generated during these discussions. Some of the themes related to big data are explored in more detail in our 'Cities of the Future' report', published on our website: www.cfse.cam.ac.uk.

Understanding risk and resilience

One of the key topics of the three meetings was the level of our current understanding of the nature of risk and resilience. This was encapsulated by Dr Emily Shuckburgh, Deputy Head of the Polar Oceans Team at the British Antarctic Survey, who identified four areas that need improvement so as to support resilience: more data collection and processing, particularly at the local level; metrics for risk, mitigation and adaptation; instruments for considering uncertainty in decision-making; and the interface between various key stakeholders of the scientific, legal and political community, amongst others. The complexity of the topic means that resilience and risk are subjective continuums, which should be reassessed after catastrophes, rather than exact thresholds.

Dr Prathivadi B. Anand, a specialist in environmental economics and public policy from the University of Bradford,

argued that there is a societal need to transparently decide what risk is acceptable and cost effective, as well as how much redundancy or resilience should be built into infrastructure. Mitigating every risk is impracticable. Striking a balance in this area is challenging as overdesigning can have unintended consequences, but is often desirable in buildings which need to function after a disaster. The general population is often not aware of risk, which can lead to complacency with regard to mitigation measures. Likewise, knowledge and experience about risk and resilience also needs to be shared between cities and institutions to increase overall preparedness for disasters.

Professor Danny Ralph, who introduced the work of the Centre for Risk Studies, also stressed this need. In 2016, the Centre examined the economic loss of 300 major world cities resulting from catastrophes, and this process emphasised where there was a lack of knowledge and models that need to be addressed in risk management thinking, such as the difficulty of assessing all systems including the social, commercial and legal sectors. Assessing systems in across different areas, sectors and levels, is also a challenge, as highlighted by Professor James Jackson, Professor of geophysics, geodynamics and tectonics in the Department of Earth Sciences. He argued that there is a disparity in the

Key questions

Through our discussions, we identified three key questions where more research is needed:

- How can we make urban planning systems more adaptive and how can knowledge about risk and resilience be shared at an urban planning level?
- How much redundancy or resilience should be built into urban infrastructure and how do we introduce redundancy into social systems?
- How can we model direct and indirect effects of catastrophes on cities if they are outside the original impact centre?

preparedness of countries exposed to earthquakes on the Pacific Rim and those in Continental Asia. The former are aware of the threat and have the wealth to enact policy. The latter, amongst other problems, struggles with complacency because of the large geographic distribution of earthquakes. In these areas, different approaches to mitigation and adaptation will be needed.

"We should not shy away from trying to talk about all threats to cities and from trying to understand that different systems within those cities have different dimensions."

Professor Danny Ralph, Centre for Risk Studies, University of Cambridge

Layers of data

Choosing the best metrics for modelling risk requires ongoing work, although the insurance industry perhaps provides a useful exemplar for considering risk. It has adopted catastrophe risk modelling and a consistent regulated framework which enforces consideration of 1 in 200 year risks. Rowan Douglas, the CEO of Capital, Science & Policy Practice at Willis Research Group, argued that sustainability and resilience should be viewed through this prism of risk and creating a coherent set of frameworks, metrics and a common language that links all the various sectors beyond just insurance is crucial. The specific metric of 1 in 200 year risk may not always be suitable as it can overlook large, rare risks. Again, society needs to consider what is an appropriate standard and how this may vary according to the local context. In New Zealand the standard for insurance is now 1 in 1000 years. Imposing minimum requirements on other organisations outside the insurance sector would force organisations to assess and disclose their risks and be fiscally responsible. More broadly, protection from climate risk could be considered a human right and the UN and OECD are starting to move in this direction.

There were numerous other challenges considered with regards to metrics. The interactions between different and successive catastrophes need more analysis, as do the direct and indirect effects of catastrophes outside the original impact centre. Events which have a wider impact, such as the eruption of the Icelandic volcano, Eyjafjallajökull, introduce more complexity and uncertainty into models and methods of incorporating such events need to be developed. A number of other uncertainties with regards to risk and resilience were also raised: How can new events that have no past analogue be modeled? How are abstract and less quantifiable challenges, such as threats to biodiversity of mental health issues in society, assessed and costed?

Sérgio Freire, a geographer working in the Global Security and Crisis Management Unit of the European Commission's Joint Research Center (JRC), discussed the manner in which big data can be useful to answer some surprisingly fundamental questions about the state of global development that are necessary for understanding our current exposure to risk: what is a city, how many and where are they and what are their sizes and shapes? Professor Michael Batty, Bartlett the Professor of Planning at UCL, explored another use of big data as an emerging tool in the context of transport planning. For example, data from London's public transport could be compared to a synthetic baseline to assess the resilience of the system in real time.

Planning future cities

The use of big data is not without its difficulties. Incorporating risk metrics and dynamic big data into planning systems is another challenge that was emphasised by Dr Elisabete Silva, a Senior Lecturer in Planning in the Department of Land Economy. She argued that current planning systems are static and there needs to be flexibility in policy and decision-making to allow for changing scenarios and quick responses to dynamic data.

Big data and planning systems also need to adapt to the dynamic expectations of individual residents. For risk and resilience concepts to be successfully adopted there has to be communication and trust between communities and policymakers. The public has to understand, and help decide, where certain areas can or cannot be sensibly protected from disaster because of a lack of finance or resources. This relationship between the various stakeholders, ranging from the government to the individual, including industry, law and finance was consistently mentioned, and it was agreed that an institution like Cambridge University could help bridge these levels.

The Cambridge Forum for Sustainability and the Environment was established in 2013 in the University of Cambridge. Chaired by Lord Martin Rees, it meets once a month, bringing together thought leaders from the worlds of research, policy and industry to talk about some of the great sustainability challenges the world faces in the future and the research pathways which will help to prepare for and address those challenges.

Secretariat: Prof. Paul Linden (Director); Dr Rosamunde Almond (Executive Secretary); Dr Konstanina Stamati and Dr Lizzie Tyler (Acting Executive Secretaries during maternity leave); Simon Patterson (Content Writer).

Forum members for this topic were drawn from 14 University centres, departments and Initiatives, including: Prof. Alan O'Neill (Cavendish Laboratory); Prof. Alison Smith and Prof. Howard Griffiths (Dept. of Plant Sciences); Prof. Danny Ralph (Centre for Risk Studies); Dr Emily Shuckburgh (British Antarctic Survey); Dr Helen Curry (Dept. of the History and Philosophy of Science); Dr Hildegard Diemberger (Dept. of Social Anthropology); Prof. Ian Hodge (Dept. of Land Economy); Prof. Ian Leslie, (Computer Laboratory); Dr Jake Reynolds and Polly Courtice (Cambridge Institute for Sustainability Leadership); Dr Julian Huppert (POLIS); Prof. Koen Steemers (Dept. of Architecture); Dr Miles Parker, (CSaP); Prof. Peter Guthrie (Dept. of Engineering); Dr Shailaja Fennell, Lecturer (Centre for Development Studies); Prof. Susan Owens (Dept. of Geography).

We would like to thank everyone who took part in Forum meetings related to this topic, especially the expert witnesses and guests who joined us from across and outside Cambridge:

Witnesses: Prof. James Jackson (Dept. of Earth Sciences, University of Cambridge); Prof. Danny Ralph (Judge Business School); Dr Elisabete A Silva (Dept. of Land Economy, University of Cambridge); Rowan Douglas (Willis Research Network, Willis Group); Dr Emily Shuckburgh (British Antarctic Survey); Dr Prathivadi B Anand (University of Bradford); Prof. Michael Batty (University College London); and Sérgio Freire (Global Security and Crisis Management Unit, EC Joint Research Centre).

University guests: Prof. Andy Hopper (Computer Laboratory); Prof. Ash Amin (Dept. of Geography); Dr Bonnie Wintle and Dr Shahar Avin (Centre for the Study of Existential Risk; Dr Marla Fuchs (Research Strategy Office); Prof. Peter Tyler (Dept. of Land Economy) and Dr Tom Herbstein, (Cambridge Institute for Sustainability Leadership) and early career researhers, including Gerry Casey, Hannah Baker and Kristin MacAskill (Dept. of Engineering and Mingfei Ma (Dept. of Architecture)

Guests from outside Cambridge: Dr Alejandro Palermo (Royal Society of Chemistry); Prof. Charlie Kennel (CSaP) and Emily Miles (Defra).

Building resilient energy supplies

How could photosynthesis-based technologies can provide a sustainable and rapidly-deployable energy source for rural communities?

At a glance

For our final three meetings centred on 'risk, resilience and response', we focused on energy resilience. Between April and June 2016, expert witnesses helped us to we explore ways in which photosynthesis-based technologies can provide a sustainable and rapidly-deployable energy source for rural communities.

In April, we focused on off-grid situations and to explore existing approaches and possible challenges while using local resources. In May and June, we turned to ways in which existing bio-energy technologies linked to photosynthesis can provide sustainable and rapidly-deployable energy and the role of policy in applying the principles of the circular economy to bioenergy provision.

This article provides an overview of key emerging themes and some of the 'wicked problems' and questions generated during these discussions. This theme was carried out in partnership with the Energy@Cambridge Strategic Initiative and the CamPlants Hub.

Living off the grid

One of the main points of discussion concerned the appropriateness of different technologies for providing energy solutions to developing areas. Professor Sir Brian Heap, Scientific Advisor of the 'Smart Villages Initiative', discussed biomass as a rapidly deployable off-grid energy solution but suggested that improvements needed to be made, including new and higher quality crops, new crop rotations, improved market efficiency and more affordable finance. However, overdependence on one particular energy approach can have unsustainable environmental consequences. Policy challenges for biofuels include the tension over land-use between energy and food production as well as issues regarding land rights; rebound effects, such as cheaper energy driving consumption higher; a lack of regulation to combat deforestation; and the need for better transport infrastructure.

The importance of biomass for food and resources led the Forum to consider additional technology options. Dr Heinz Ossenbrink, the Head of Renewables and Energy Efficiency Unit at the EC Joint Research Centre, discussed photovoltaic energy as an efficient option for energy production. Edgar Blanco, the Research & Development Manager at AnDigestion Ltd and a specialist on anaerobic digestion, mentioned various photosynthetic opportunities such as photosynthetic fertilisers and a need for more water-based solutions. Professor Chris Howe, Professor of Plant and Microbial Biochemistry in the the Department of Biochemistry at Cambridge, discussed biophotovoltaics, a new technology that harnesses electrons produced as a byproduct of the photosynthetic process, which could potentially be scaled up to charge mobile phones.

Key questions

Through our discussions, we identified four key areas where more research is needed:

- How can bioenergy innovation be introduced wholesale into communities and how can technology be implemented in areas of rural poverty?
- How can sustainable and cost-effective fuels from biomass be delivered at a large scale, and what would encourage investors and markets to make long-term commitments?
- How important are technical solutions to solving global energy problems and how can these be developed in parallel with novel, and potentially unconventional, policy solutions?
- Is it feasible or sensible to move towards a circular economy primarily based on biological resources?

Catalyzing new research

A recurring theme during these discussions centred on ways in which photosynthetic processes can be part of a bioenergy technology 'package' that might also address energy, water, nutrition and waste challenges in the developing world. The term 'circular photosynthesis' was coined to encompass this concept, and the ideas discussed in the Forum have since been developed further and been included in research funding proposals.

It was agreed that although improvements can be made, generally the technological capacity to solve problems already exists. No one technology will provide a solution, and direct and indirect energy savings need to be considered. Thus, in all three of the meetings the necessity for a holistic and multidisciplinary approach to energy was highlighted. The human energy footprint, encompassing food, water, energy and space requirements, must be considered as a whole. This could also help grasp the opportunity to combine energy production with other industry sectors, such as agriculture or waste disposal. Dr Rana Pant, from the Life Cycle Assessment and Environmental Footprint, Sustainability Unit at the EC Joint Research Centre (JRC), advocated a process known as life-cycle assessment, whereby a situation is assessed so that all ramifications of an action or policy are understood so as to avoid shifting the energy burden to a different region, time or part of system.

"Access to electricity is not the end goal in itself, it has to be a means towards an end and it has to mean something for the community."

Dr Muhammad Tayyab Safdar, Centre of Development Studies, University of Cambridge

From the ground up

It was frequently emphasised that there needs to be better engagement with and understanding of local populations; different areas need different solutions, and these must be tailored for a local context. For example, Dr Muhammad Tayyab Safdar, a Post-Doctoral Research Associate at the Smart Villages Initiative, pointed out that off-grid energy must serve a purpose, be it improving access to business opportunities, health care or education. The communication pathways between scientist and consumer need to be improved so that public scepticism regarding new technologies can be overcome. Dr John Mullet, the Director of SOWTech and an expert on waste solutions, emphasised that traditional practices are a key barrier to the success of energy projects, and the continued use of inefficient cooking stoves and charcoal was used to elucidate this point. Conversely, rural or developing communities can also be creative and innovative. Community engagement, education and further research into the mechanisms by which behavioural change can be encouraged are required.

Financial and policy challenges were a constant theme of the forum. New markets are needed that can adapt to the business model required for renewable energy sources, which involves heavy initial investment but long-term savings. Currently, companies need a lot of capital and it can be difficult for developing countries to establish subsidies, which may not be necessarily be a sustainable solution but can help demonstrate the viability of business models to encourage future private investment and consumer uptake. These financial barriers are exacerbated by subsidies for

fossil fuels. There needs to be greater policy clarity in developing countries, and globally the international community needs to explore unconventional policy solutions such as carbon passports or pricing, waste taxes and making people aware of the impact of their energy choices.

To aid policy decisions and create interventions that are appropriate for any given area requires interconnected modelling of the different elements. Paul Newell, a statistician in the Energy Science team at the Met Office, highlighted the unified nature of their models for local, regional and global hazards. They can also provide data regarding the best location for wind turbines or solar panels. Dr Jeremy Woods, a lecturer in bioenergy at Imperial College London, introduced the Global Calculator, a tool that shows the major points of action to mitigate climate change and the unforeseen impacts of policy change.

Circular economies

Combining these threads, the final forum focused on circular economies. Rob Mills, the Head of European Energy Markets at Ofgem, observed that in developing communities resource efficiency is often already high as a result of necessity. Again, a holistic view is needed to factor the interplay between household economics, price signals, societal norms and undermining existing markets and all the other possible trade-offs and rebound effects. The mechanisms that help motivate and inform people so they commit to environmental efforts need further research.

The Cambridge Forum for Sustainability and the Environment was established in 2013 in the University of Cambridge. Chaired by Lord Martin Rees, it meets once a month, bringing together thought leaders from the worlds of research, policy and industry to talk about some of the great sustainability challenges the world faces in the future and the research pathways which will help to prepare for and address those challenges.

Secretariat: Prof. Paul Linden (Director); Dr Rosamunde Almond (Executive Secretary); Dr Konstanina Stamati and Dr Lizzie Tyler (Acting Executive Secretaries during maternity leave); and Simon Patterson (Content Writer and Editor).

Forum members for this topic were drawn from 15 Departments, Centres and Institutes, and included: Prof. Alan O'Neill (Cavendish Laboratory); Prof. Alison Smith and Prof. Howard Griffiths (Dept. of Plant Sciences); Prof. Danny Ralph (Centre for Risk Studies); Dr Emily Shuckburgh (British Antarctic Survey); Dr Helen Curry (Dept. of the History and Philosophy of Science); Dr Hildegard Diemberger (Dept. of Social Anthropology); Prof. Ian Hodge (Dept. of Land Economy); Prof. Ian Leslie, (Computer Laboratory); Dr Jake Reynolds and Polly Courtice (Cambridge Institute for Sustainability Leadership); Dr Julian Huppert (POLIS); Prof. Koen Steemers (Dept. of Architecture); Dr Miles Parker, (CSaP); Prof. Peter Guthrie (Dept. of Engineering); Dr Shailaja Fennell, Lecturer (Centre for Development Studies);and Prof. Susan Owens (Dept. of Geography).

Witnesses: Prof. Sir Brian Heap (Smart Villages Initiative); Dr Heinz Ossenbrink and Dr Rana Pant (EC Joint Research Centre - JRC); Dr Muhammad Tayyab Safdar (Institute of Continuing Education (ICE), University of Cambridge); Edgar Blanco (Andigestion Ltd); Prof. Chris Howe (Dept. of Plant Sciences); Dr John Mullett (SOWTech (Sustainable OneWorld Technologies) CIC); Rob Mills (Ofgem); Paul Newell (Met Office); and Dr Jeremy Woods (Centre for Energy Policy and Technology - ICEPT).

Guests: Dr Nicolette Bartlett (Cambridge Institute for Sustainability Leadership); Dr Matthew Davey and Dr Mariana Fazenda (Dept. of Plant Science); Prof. David Newbury (Faculty of Economics); Dr Marc Ozawa and Dr Isabelle de Wouters (Energy@Cambridge Strategic Research Initiative). Early career researchers included Carolina Feijao Dept. of Biochemistry), and Richard Sidebottom (Centre of Development Studies).

Making connections

How do urban environments, such as green spaces and where we live and work, influence our health and wellbeing?

At a glance

Starting in October 2016, our topic was 'connecting health, wellbeing and sustainability' and for two thirds of the year, we focused on generating questions which made these connections in the context of places where we live and work...

In the first term (October, November and December) of the academic year, the meetings examined internal and external environments and how they can be designed to benefit people's health and the role that policy as well as communities could play in shaping places in ways that benefit both people and the environment. In the final term (May and June) the discussed the gap between theory and reality with respect to these environments.

This article provides an overview of these five discussions and some of the 'wicked problems' and questions they generated. The role that green spaces play in cities as a whole is explored in more detail in our 'Cities of the Future' report', published on our website: www.cfse.cam.ac.uk.

Framing the debate

Across all meetings, the benefits of green space for human wellbeing, happiness and sustainability were extolled, with evidence cited from fields such as neuroscience, epidemiology, economics, sociology and psychology to demonstrate the diverse impact green space has on our mental and physical health. It was suggested that the benefits of green space on our happiness may not dampen over time, and Tom Armour, Global Landscape Architecture Leader at Arup, said that the green environment is currently undervalued in urban design and should be an intrinsic part of our approach in order to build healthier cities. Similarly, Professor Matthew Gandy, Professor of Cultural and Historical Geography in the Department of Geography, encouraged a greater appreciation of urban biodiversity and called for further research into how to incorporate the spontaneous dynamics of nature into urban planning.

The definition of terms, their usefulness and our understanding of them was a key point of discussion across all meetings. The usefulness of wellbeing and happiness as metrics was also examined, with the latter considered a particularly subjective term that may detract attention from more concrete issues. Professor Catherine Ward Thompson,

Professor of Landscape Architecture and Director of the OPENspace research centre at the University of Edinburgh, triggered discussion regarding the concept of green space: How much is enough for human wellbeing? What qualities should green space have? How natural should green space be? Knowing the answers to such questions is vital so that we can preserve and replicate environments with the greatest positive influence on human wellbeing and happiness. Dr Ross Cameron, Senior Lecturer in Department of Landscape at the University of Sheffield, emphasised that green spaces need to be optimised for multifunctional uses, particularly for ecosystem services, but how this is done is dependent on the differing needs of the surrounding locale. All these questions highlight a recurrent thread through the meetings: the need for more data and research. This was emphasised by Dr Scott Hosking, a Climate Scientist for the British Antarctic Survey, who called for more specialised climate models informed by ground-truthed data.

Catalyzing change

However, the need for such metrics was also identified as a way of framing a business case to policymakers and decision

Key questions

Through our discussions, we identified four key areas where more research is needed:

- How 'natural' does a green space need to be to have a positive impact on people's wellbeing?
- How important is 'greenness' in providing these benefits? Are there commonalities between the effect of green spaces on our wellbeing and the effect of spaces we perceive to be beautiful or pleasing to us?
- How do we reconcile conflicts between aesthetic appeal and functional requirements of urban green spaces?
- How can we create educational systems that encourage children to interact with nature and what role could green spaces play for those living in cities?

makers, and this was a common concern across the meetings. Catalyzing change in policy is difficult even when the benefits of an approach are obvious. However, there are opportunities for change. Dr Gillian Petrokovsky, James Martin Fellow in the Oxford Long-Term Ecology Lab, emphasised the need for multidisciplinary work and crosssector partnerships by demonstrating the value of neglected silvacultural knowledge as a resource for agricultural and urban spheres. Additionally, the public's increasing awareness of terms such as wellbeing and sustainability and the current tumultuous political landscape is an opportunity to impress different ideas on policymakers and the public. Dr Ellie Robinson, Assistant Director of External Affairs at the National Trust, described some of the work done in this area by her organisation, which uses natural capital accounting to demonstrate the value of green space. However, the dangers of monetising value as a result of the push to influence policy were acknowledged, as were the risk of ratings tools preventing a holistic approach to project design. In addition, Dr Peeter Pärt, Advisor in Environment and Human Health Interactions at the Joint Research Centre of the European Commission, warned of the dangers of colliding policies and suggested that finding ways to combine sustainability and wellbeing needs further research.

Two barriers were consistently identified with regards to policy change. The first was that the political and democratic system often precludes long-term planning and over shortterm thinking, particularly with regards to major projects in the built environment. The other was the need to improve public engagement with the environment and environmental issues. This is particularly important when it comes to protecting invisible or unglamorous assets such as biodiversity or insect species. Craig Bennett, CEO of Friends of the Earth (England, Wales and Northern Ireland), advocated a greater democratisation of resources, improved public consultations and increased levels of education to help both reduce inequality and overcome incumbencies in the way we think. Improved education and public outreach is also a core part of the work of Dr David Cope, Director of Strategy and External Affairs at the Royal Botanical Gardens, Kew. He advocated the need for resilient cities to connect people to nature by design, and in so doing help deepen the connection and awareness with green spaces and promoting environmental issues politically.

From theory to reality

Two speakers provided practical examples of an urban setting which incorporates green space and environmental considerations. Ron Bakker, Founding Partner of PLP Architects, described his work on The Edge, which is an example of a private investment that recognised a business model that valued sustainability, incorporated long-term thinking and engagement with the public. As a building, The Edge is sustainable and efficient in its use of space and is adaptable, creating opportunities for its users to interact with and alter the environment through daily communicative connections, and Ron advocated this design approach for cities. In a similar vein, Andrew Grant, the Founding Director of Grant Associates, presented a vision for green spaces in cities through the Singaporean project 'supertrees' which, whilst functional, provides a diverse, natural experience within a city, allowing people to reconnect with nature.

As part of the pressing need to assess the value of green spaces, two speakers presented their innovative research into connecting happiness and wellbeing in relation to space. Dr Dimitris Ballas, a Senior Lecturer at the Department of Geography, explores the connection between wellbeing and social spaces by comparing objective measures with social survey data and then using multi-level modelling and

simulations to create a contextual picture that can help inform social policy regarding incorporating wellbeing into urban planning. Laurie Parma, a researcher based within the Policy Research Group at the Department of Psychology, examines the relationship between biodiversity and human wellbeing by gathering quantitative demographic and survey data through an app, Naturebuzz, and then mapping the results to help us understand whether some green spaces are more valuable than others. Professor Felicia Huppert, Director of the Well-being Institute in Cambridge, emphasised the need for more data in this area, particularly as wellbeing is not a static concept, and different populations will respond in various ways to the natural environment.

The Cambridge Forum for Sustainability and the Environment was established in 2013 in the University of Cambridge. Chaired by Lord Martin Rees, it meets once a month, bringing together thought leaders from the worlds of research, policy and industry to talk about some of the great sustainability challenges the world faces in the future and the research pathways which will help to prepare for and address those challenges.

Secretariat: Prof. Paul Linden (Director); Dr Rosamunde Almond (Deputy Director); Dr Konstanina Stamati (Head of Partnerships and Development); Simon Patterson (Content Writer and Editor)

Forum members for this topic were drawn from 21 Departments, centres and institutes, including: Prof. Alan O'Neill (Cavendish Laboratory); Prof. Alison Smith, Dr Mariana Fazenda and Prof. Howard Griffiths (Dept. of Plant Sciences); Prof. Andy Hopper and Prof. Ian Leslie (Computer Laboratory); Prof. Carol Brayne (Dept. of Public Health and Primary Care, Institute of Health); Prof. David Dunne (Dept. of Pathology and Cambridge Africa); Dr David Pencheon (NHS Sustainable Development Unit); Dr Emily Shuckburgh (British Antarctic Survey); Dr Erwin Reisner (Dept. of Chemistry); Dr Hildegard Diemberger (Dept. of Social Anthropology); Dr Jake Reynolds and Polly Courtice (Cambridge Institute for Sustainability Leadership); Dr Julian Huppert (Jesus College Intellectual Forum); Prof. Koen Steemers (Dept. of Architecture); Prof. Nick Wareham (UKCRC Centre for Diet and Activity Research); Prof. Peter Guthrie (Dept. of Engineering); Dr Rob Doubleday (Cambridge Centre for Science and Policy - CSaP); Prof. Roderic Jones (Dept. of Chemistry); Dr Shailaja Fennell (Centre of Development Studies); Dr Simon Beard (Centre for Existential Risk - CSER); Prof. Simon Redfern (Dept. of Earth Sciences); Dr Stephen Cave (Leverhulme Centre for the Future of Intelligence)

Witnesses: Andrew Grant (Grant Associates); Prof. Catharine Ward Thompson (University of Edinburgh); Craig Bennett (Friends of the Earth); Dr David Cope (Royal Botanical Gardens Kew); Dr Dimitris Ballas (University of Sheffield); Ellie Robinson (National Trust); Prof. Felicia Huppert Wellbeing Institute in Cambridge and the Institute for Positive Psychology & Education at Australian Catholic University); Dr Gillian Petrokofsky (Oxford Martin School, Oxford University); Laurie Parma (Dept. of Psychology); Prof. Matthew Gandy (Dept. of Geography); Dr Peeter Part (Joint Research Centre, European Commission - JRC); Ron Bakker (PLP Architects); Dr Ross Cameron (University of Sheffield); Dr Scott Hosking (British Antarctic Survey); and Tom Armour (Arup)

University guests: Claire Higgit (Research Strategy Office); Prof. Alan Short, Prof. Marcial Echenique, Theodora Bowering, Linda Nkatha Gichuyia and Mingfei Ma (Dept. of Architecture); Dr Maria Abreu (Dept. of Land Economy); Dr Megan Davies Wykes (Dept. for Applied Mathematics and Theoretical Physics - DAMTP); Dr Rob Foster (Centre for Natural Materials Innovation); Prof. Eric Wolf (Dept of Earth Sciences); Prof. Larry Sherman (Dept of Criminology); Sarah Steele (Jesus Intellectual Forum); Tennie Videler (Public Health@Cambridge Network) and Eleanor Winpenny (MRC Epidemiology Unit).

Guests from outside Cambridge: Andrew Limb (Cambridge City Council); Annelisa Grigg (UNEP World Conservation Monitoring Centre); Ingrid Abreu Scherer (What Works Centre for Wellbeing); Kirsten Henson, (KLH Sustainability); and Dr Roger Mitchell (Cambridge Conservation Forum).

Diets in a changing world

How may our diets change in the future and what does an environmentally sustainable and healthy diet look like?

At a glance

Our third topic explore connections between health, wellbeing and sustainability and between January and March 2017, expert witnesses from the worlds of policy, research and industry helped us to explore questions related to the food we eat.

At the first meeting in January, we started by looking at how our diets may change in the future and ways in which these changes could impact the environment. In February, we turned to what drives the choices people make and in March, we discussed 'catalysing change' and the role that policy and advocacy could play in changing what people eat. This article provides an overview of these three discussions and some of the 'wicked problems' and questions they generated.

Taking a global view

There was general agreement across the three forums that when it comes to what constitutes a 'good' diet and its importance with regard to health, wellbeing and sustainability there is a large, albeit evolving, evidence base. There remain some outstanding areas to explore, such as determining exactly what nutritional factors are best for human health. Diet is a multidisciplinary and multicriteria problem, which Tim Lang, Professor of Food Policy at City University London's Centre for Food Policy, related to food quality, health, environment, social and cultural issues relating to diet, economics and governance. Charles Godfrey, Hope Professor and Director of the Oxford Martin Programme on the Future of Food at Oxford University, emphasised that health and the environment overlap and can have cobenefits, but exactly how these interrelate and how negative rebound effects can be avoided was a frequent discussion point.

There was also agreement that, overall, rapid change of the food system is needed for health and environmental reasons, although it was noted that in some instances maintaining the

status quo in areas of good practice will be just as challenging. Dr Marco Springmann, from the Oxford Martin Programme on the Future of Food, asserted that animal-based diets are unhealthy and unsustainable, and that food production will exceed emissions targets if land change is also considered.

Catalyzing change

Dr Michael Obersteiner, the Program Director of the Ecosystems Services and Management (ESM) Program at IIASA - Institute for Applied Systems Analysis - in Austria, and others considered whether policy interventions should occur at the point of consumption or point of production. At the moment interventions are often at the supply end and changing our demands could have a greater impact. There was disagreement across the Forums as to which of these intervention points were most important; however, it was agreed that both were vital and could serve different purposes.

Key questions

Through our discussions, we identified four key questions where more research is needed:

- How can we reach an understanding about what constitutes a sustainable and healthy diet?
 Should our approach be to create a global vision of this concept or to have regionalised versions that factor in local contexts?
- How can we communicate research in a way that influences individual behaviour and what people choose to eat? How do you unpick which factors ultimately have the most significant impact?
- What is the best policy approach to influence the choices people make?
- Can we apply lessons from marketing to public health interventions?

Policymakers often know the changes that can make people's diets healthier, but how to catalyse those changes is much less clear. There are very few existing models for large-scale interventions at the population or even community-level. Examples from other European countries and the US has shown that food and drink-related taxes are politically sensitive; subsidies can have unintended adverse consequences for the environment; certifications can lack a solid evidence base; and clear, effective food labels are hard to achieve. Modelling studies can examine the theoretical effect of policy changes and these also need to be 'groundtruthed' with information about how people behave in real life. Even when the correct policy approach is known, public opinion needs to be galvanised so that policymakers can be emboldened to enact interventions that can affect behavioural change. Professor Theresa Marteau explained that communicating evidence concerning the intervention can make it more acceptable to the public and suggested that the public sector could encourage behavioural change in advance of cultural shifts.

Whether policy interventions should occur at a population or individual level was also discussed. Dr Brent Loken, from the EAT Initiative in Oslo, suggested that the urgency of the issue meant that population-level changes were more effective and vital, but could be supported by interventions at other levels. Each population, and its demographic subsets, will require a different approach.

Making information easier to digest

It is hard for the public to access and absorb the complex information regarding diet, and as a result they become sceptical and revert to default practices. Although digitisation offers opportunity to convey information more effectively, health and environmental messages alone will not change our food culture: a holistic, systems approach is required. Bee Wilson, a food writer and historian, suggested that a change in approach is required. For example, people's malleable flavour preferences could be changed so that they actively enjoy healthy food over sugary treats. She and others recognised the importance of education as all levels, but especially at a young age, in changing our relationship to the environment and food production.

"Instead of telling people to eat broccoli, make us like broccoli and then we won't have to be told."

Bee Wilson, food writer, journalist and historian

Looking at industry, there is scope to optimise agricultural practice, and this could cause beneficial indirect land-use change. Professor Martin White, from the UKCRC Centre for Diet and Activity Research (CEDAR) suggested that regulation was probably necessary in this area as voluntary commercial change had not been forthcoming, but this can have negative consequences if the cost is passed on to other areas. He argued that as things stand, the food and drinks industry has too much power, and the mechanisms by which public pressure on industry can be created needs investigation. Crucially we need to know more about how the food industry influences dietary choices.

There are many layers between researchers and the individual consumer, and research is needed into how messages can be communicated clearly so as to influence behaviour. Professor Sumantra Ray, the Founder and Executive Director of the NNEdPro Global Centre for

Nutrition and Health in Cambridge, advocated the need for effective and trusted knowledge brokers, such as healthcare professions, that would help people to understand the evidence behind diets, and the research community needs to take an active role in this process.

With the rapid pace of urbanisation, these problems need to be addressed before they become unmanageable. A final thought considered whether policy change directly focused on the global food system was enough to catalyse significant change by itself or whether the status quo of other large-scale economic forces can lead to inertia in food policy.

The Cambridge Forum for Sustainability and the

Environment was established in 2013 in the University of Cambridge. Chaired by Lord Martin Rees, it meets once a month, bringing together thought leaders from the worlds of research, policy and industry to talk about some of the great sustainability challenges the world faces in the future and the research pathways which will help to prepare for and address those challenges.

Secretariat: Prof. Paul Linden (Director); Dr Rosamunde Almond (Deputy Director); Dr Konstanina Stamati (Head of Partnerships and Development); and Simon Patterson (Content Writer and Editor).

Forum members for this topic were drawn from 21 Departments, centres and institutes and included: Prof. Alan O'Neill (Cavendish Laboratory); Prof. Alison Smith, Dr Mariana Fazenda and Prof. Howard Griffiths (Dept. of Plant Sciences); Prof. Andy Hopper and Prof. Ian Leslie (Computer Laboratory); Prof. Carol Brayne (Dept. of Public Health and Primary Care, Institute of Health); Prof. David Dunne (Dept. of Pathology and Cambridge Afria); Dr David Pencheon (NHS Sustainable Development Unit); Dr Emily Shuckburgh (British Antarctic Survey); Dr Erwin Reisner (Dept. of Chemistry); Dr Hildegard Diemberger (Dept. of Social Anthropology); Dr Jake Reynolds and Polly Courtice (Cambridge Institute for Sustainability Leadership); Dr Julian Huppert (Jesus College Intellectual Forum); Prof. Koen Steemers (Dept. of Architecture); Prof. Nick Wareham (UKCRC Centre for Diet and Activity Research); Prof. Peter Guthrie (Dept. of Engineering); Dr Rob Doubleday (Cambridge Centre for Science and Policy - CSaP); Prof. Roderic Jones (Dept. of Chemistry); Dr Shailaja Fennell (Centre of Development Studies); Dr Simon Beard (Centre for Existential Risk - CSER); Prof. Simon Redfern (Dept. of Earth Sciences); Dr Stephen Cave (Leverhulme Centre for the Future of Intelligence) and Prof. Susan Owens (Dept. of Geography)

We would like to thank everyone who took part in Forum meetings, especially the expert witnesses and guests who joined us from across and outside Cambridge and who contributed their time, knowledge and expertise:

Witnesses: Dr Michael Obersteiner (International Institute for Applied Systems Analysis - IIASA); Dr Marco Springmann (Department of Population Health, Oxford University); Prof. Sumantra (Shumone) Ray (MRC Elsie Widdowson Laboratory, University of Cambridge); Prof. Martin White (CEDAR); Bee Wilson (Food writier, journalist and historian); Prof. Charles Godfray (Oxford Martin Programme on the Future of Food, Oxford University); Prof. Tim Lang (Department of Sociology, City University of London); Dr Brent Loken (EAT Foundation, Oslo); Prof. Theresa Marteau (Behaviour and Health Research Unit, University of Cambridge)

Guests: Prof. Andrew Balmford (Dept. of Zoology); Dr Charlotte Sausman (Public Policy Strategic Research Initiative); Dr David Reiner (Judge Business School); Jacqueline Garget (Strategic Research Initiative in Global Food Security); Dr Jean Adams (CEDAR) and Nicola Buckley (CSaP).

From outside Cambridge: Prof. Charlie Kennel (Visiting Research Fellow, CSaP) and a number of CSaP Policy Fellows, including John Curnow (Defra); Julie Pierce, (Food Standards Agency); and Tom Hook, (London Borough of Barking and Dagenham).
